Consequently, we do not include links to any commercial sites that may not be complimentary or relevant to our work. The other two isoforms only exist in vertebrates, but their function in vertebrates is yet unknown. In this study, we provide evidence that the Aluq1/2-like and Alujr1 are related to RNA metabolism. The Aluq1/2-like RNA gene encodes the p66 subunit of the RISC PAZ domain, and the Alujr1-encoding gene encodes one of the nucleocapsid proteins of the RNP complex. We found that the Aluq1/2-like gene was expressed in the brain during development and in adults. This result indicated that Aluq1/2-like is important for the development and/or maintenance of brain function. The Alujr1 gene was ubiquitously expressed at high levels in all tissues and was upregulated in some tissues of the fruit fly (Fig. 3c). The sequence of the Alujr1 protein is highly conserved in all fly species examined, consistent with its conserved function in the nervous system of the fly. The Alujr1 protein also shares sequence similarity to human EIF4A3, a component of the Eukaryotic Translation Initiation Factor 4A (eIF4A) complex, and three other members of the EIF4A protein family in invertebrates. Our RNA-seq data on the fly brain also revealed that the EIF4A3 gene was highly expressed in the fly brain (Jin et al. 2015), suggesting that EIF4A3 may be involved in neural function
