HOT

51 creating surfaces with surpac autoplot the surpac autoplot function is used to calculate 2d and 3d surfaces from the data in your database. you can use autoplot to create surfaces in three ways: 1. create a closed surface from a database containing only points. 2. create a closed surface from a database containing points and vectors. 3. create a closed surface from a two-dimensional grid. note: autoplot is a tool for creating surfaces. it does not create graphics; instead it calculates surfaces that can be displayed in graphics tools. you will need to click apply on any forms presented. questions review questions i. in this tutorial, a text editor is used to edit pit_design1.str. the pit_design1.str file is not saved, since it is edited manually.str file consists of two segments. the segment at the end is closed, since it consists of the same data that the segment at the beginning is. however, the segment at the beginning is open, since it is different data. the differences between these segments are described as follows: segment1. the first segment is open since the last point is different. segment2. the second segment is closed since the first point is the same. note: segment id numbers increase from one segment to another. for example, the id numbers for the first segment are 1,2, and so on. id numbers for the second segment are 2,3, and so on. 4. if the segment at the end of the file is closed, the last segment is open. it is not recommended to manually edit string files, as you can make mistakes. this can result in the file being unable to be read by surpac. you should create a new file if you need to make changes to a string file. if you manually edit a string file, you need to type 0.00 in the first line of the file to make sure the file is correct. 6. if the segment at the beginning of the file is closed, the first segment is open. page 47 of 237
